Function Overview

This program is developed based on Visual Basic 2010 and is designed to calculate the Air Quality Index (AQI) according to the **Ambient Air Quality Standards** (GB 3095-2012) and provide an evaluation of the air quality level.

Program Overview

The program assesses six air pollutants: **SO₂ (Sulfur Dioxide)**, **NO₂ (Nitrogen Dioxide)**, **PM₁₀**, **PM_{2.5} (Particulate Matter)**, **O₃ (Ozone)**, and **CO (Carbon Monoxide)**.

Evaluation Process

1. The first step is to compare the measured concentration values of each pollutant against the graded concentration limits specified in the **GB 3095-2012** standard. The **Individual Air Quality Index (IAQI)** for each pollutant is calculated using the following formula:

$$IAQIP = (BPHi - BPLo) \times (CP - BPLo) \div (BPHi - BPLo) + IAQILo$$

Where:

- **IAQI_P** = Individual Air Quality Index of pollutant P
 - **CP** = Measured concentration of pollutant P
 - **BPHi** = Upper limit of the concentration range closest to CP (as per AQI index table)
 - **BPLo** = Lower limit of the concentration range closest to CP (as per AQI index table)
 - **IAQIHi** = IAQI value corresponding to **BPHi**
 - **IAQILo** = IAQI value corresponding to **BPLo**
2. The second step is to determine the **AQI** as the maximum IAQI among all pollutants. If the **AQI exceeds 50**, the pollutant with the highest IAQI is identified as the **primary pollutant**:

$$AQI = \max(IAQI_1, IAQI_2, \dots, IAQI_n)$$

Where:

- **IAQI** = Individual Air Quality Index
 - **n** = Number of pollutants
3. The third step is to classify the air quality level based on the AQI value, determine the air quality category, display the corresponding color, and provide **health impact guidance and recommended measures**.

In summary, **AQI is the maximum IAQI among all pollutants**.

- Users must **input the 24-hour average concentration values** of the measured pollutants into the respective input fields.
- Clicking the "**Calculate**" button computes the **IAQI** for each pollutant.
- Clicking the "**AQI Calculation**" button calculates the AQI for the day.
- Clicking the "**Air Quality Evaluation**" button provides an assessment of air quality.

空气质量评价: 空气质量级别为三级, 空气质量状况属于轻度污染。此时, 易感人群症状有轻度加剧, 健康人群出现刺激症状。建议儿童、老年人及心脏病、呼吸系统疾病患者应减少长时间、高强度的户外锻炼。

Real-Time IAQI Calculation

- If **hourly IAQI values** are needed, users must:
 1. Select the pollutant to be calculated.
 2. Enter the **1-hour average concentration** in the input field.
 3. Click the "**Calculate**" button to compute the IAQI automatically.
